

## SERIES 20 CARBON COMPOSITE ROUTER

SGS Carbon Composite Routers were designed for maximum performance in CFRP materials. We partnered with a leading Aerospace company to launch the original Series 20, a design focused on trimming and finishing in demanding applications requiring minimal fiber breakout and delamination.

- The multi-flute design and positive geometry cleanly shear through the material with minimal pressure without delamination issues
- The unique clearance grind minimizes the contact between the tool diameter and workpiece, eliminating friction and pressure concerns
- Left hand flutes engineered to control the fibers within CFRP, preventing excessive fiber breakout
- Greater edge finish with longer tool life
- Available with and without end cut
- Now available with Di-NAMITE coating option

### *Performance by Design*

**The Original CCR is now available in a diamond coated option for maximum abrasion resistance and increased tool life.**
